The Life After Death Project-What Comes After Death? by Richard Matheson, Whitley Strieber and Dannion Brinkley is a series of interviews of best-selling authors, top science professors, well respected mediums and actual witnesses who provide testimony on their research and personal experiences with persons who have died. The interviews are set forth on a DVD set. The first DVD delineates the story of Forrest J. Ackerman; whereas the second DVD relates actual testimonies of witnesses to unexplained phenomena surrounding dying patients at the time of death and afterward.

The story begins on the first DVD with a brief synopsis of the life and death of Forrest J. Ackerman who was a founding father of Hollywood science-fiction. Apparently he refuses to die, as evidenced by mysterious communications with the living by computer, ink blots, and a clock that ceased to tick at the exact time of his death. Scientists tested the ink blots under an electron microscope and could not pinpoint the materials science of the ink markings.

Gary Schwartz, PhD explained that the subject of energy and consciousness after death is a continuing research puzzle similar to the behavior of stars which continue to emanate light long after their light extinguishes. The filmmakers point to various objects of scientific interest, for instance, a Zimbabwe mask that emits a huge electric charge.

The second DVD concentrates on testimonies from nurses. They describe how dying patients have a white light emanating from the mouth, as well as a golden orb rise from the body at the time of death. The International Association For Near Death Studies found that people who've had near death experiences develop tremendous insight and unusual psychic abilities not present before.

The Life After Death Project brings scientists closer to establishing life after death. Much of the evidence is testimonial. Some evidence consists of readings on scientific instruments.

More needs to be done in order to capture pictures of the human aura/chakras present during life and at the time of death. Specific physics experiments need to be set up and conducted on mysterious golden orbs and light present at or near the time of death. For sure, the scientific evidence is evolving as the test instruments become more sophisticated. Only time and additional research will provide conclusive answers on what happens after death. Jesus Christ shed light on the afterlife when He stated: "I will be with you- always. "

About Dr Joseph S Maresca

I've taught approx. 34 sections of collegiate courses including computer applications, college algebra, collegiate statistics, law, accounting, finance and economics. The experience includes service as a Board Director on the CPA Journal

and Editor of the CPA Candidates Inc. Newsletter. In college, I worked as a statistics lab assistant. Manhattan College awarded a BS in an allied area of operations research. The program included courses in calculus, ordinary differential equations, probability, statistical inference, linear algebra, the more advanced operations research, price analysis and econometrics. Membership in the Delta Mu Delta National Honor Society was granted together with the degree. My experience includes both private account and industry. In addition, I've worked extensively in the Examinations Division of the AICPA from time to time. Recently, I passed the Engineering in Training Exam which consisted of 9 hours of examination in chemistry, physics, calculus, differential equations, linear algebra, probability/statistics, fluids, electronics, materials science/structure of matter, mechanics, statics, thermodynamics, computer science, dynamics and a host of minor subject areas like engineering economics. A very small percentage of engineers actually take and pass the EIT exam. The number has hovered at circa 5%. Several decades ago, I passed the CPA examination and obtained another license in Computer Information Systems Auditing. A CISA must have knowledge in the areas of data center review, systems applications, the operating system of the computer, disaster recovery, contingency planning, developmental systems, the standards which govern facility reviews and a host of other areas. An MBA in Accounting with an Advanced Professional Certificate in Computer Applications/ Information Systems, an Advanced Professional Certificate in Finance and an Advanced Professional Certificate in Organizational Design were earned at New York University-Graduate School of Business (Stern). In December of 2005, an earned PhD in Accounting was granted by the Ross College. The program entrance requires a previous Masters Degree for admittance together with a host of other criteria. The REGISTRAR of Ross College contact is: Tel . US 202-318-4454 FAX [records for Dr. Joseph S. Maresca Box 646 Bronxville NY 10708-3602] The clinical experience included the teaching of approximately 34 sections of college accounting, economics, statistics, college algebra, law, thesis project coursework and the professional grading of approx. 50,000 CPA examination essays with the American Institute of Certified Public Accountants. Additionally, membership is held in the Sigma Beta Delta International Honor Society chartered in 1994. Significant writings include over 10 copyrights in the name of the author (Joseph S. Maresca) and a patent in the earthquake sciences.
